

## Mireth Technology's NetShred X

We have featured other excellent Mireth Technology software before in the DoubleClick, most notably **Mireth Music Man for Mac OS X** and **Mireth ShredIt for Mac OS X**. Now we'll take a look at **Mireth NetShred X**.

Mireth Tech is located in Vancouver, BC and has been creating Mac utilities since 1991.

The Mireth Technology Corp. has released version 4.2 of **NetShred X**, its easy to use internet track eraser that erases internet tracks, such as cache, history and email. NetShred X runs on Mac OS X. Version 4.2 adds support for Firefox 3, Camino 1.6, Omniweb 5.7, iCab 4.1, Opera 9.5, SeaMonkey 1.0. **NetShred X** works with all versions of Mac OS X, including Mac OS X.5 Leopard and is a Universal Binary that works on Power PC and on Intel Macs.

When it comes to computers (and especially when it comes to computers on the internet), there is no privacy unless you consciously create it. A lot of the wonderful software programs we have looked at in our presentations at the MaUsE club meetings and written about here in the MaUsE DoubleClick have demonstrated just how easy it is for a determined snooper to rescue data or salvage files from media which has been erased, reformatted or accidentally damaged. Somewhere on your computer your web browser cache stores copies of your email messages and a list of all the websites you visit when you use the internet. With a little bit of knowledge and effort, anyone with access to your computer can see what information you have been searching for and what pages you have been accessing on the web. These internet tracks not only potentially compromise your privacy, they can also take up a lot of disk space. These files are not removed from your hard drive when you clear cache, delete these files or throw them in the trash. To erase these internet tracks, you need to use an internet

track eraser to erase them so they can't be recovered. We've looked at file security software before, programs like SuperScrubber and Mireth ShredIt X, designed to securely erase your sensitive files either individually or in batches, so you can make sure that they will never be recoverable. The problem with most solutions, even the important ones like security and data backup programs, is that unless they run automatically, in the background, people simply do not consistently remember to use them.

You can protect your online privacy with Mireth Technology **NetShred X**, the easy-to-use internet track eraser for Mac OS X that securely erases cached files your browser and email programs leave behind. Within the industry, this type of internet privacy software has been called by many different names, but they all basically do the same thing - erase the work files you create when you use the internet.

Once installed and configured, NetShred X runs automatically. No privacy software is going to work if you don't use it, so NetShred X was designed to be easy to use. Just quit from your browser or email program and NetShred X will erase your internet tracks automatically. NetShred is the easiest way to erase internet tracks and email on your Mac.

NetShred X is fast because you don't have to wait for it. Just run NetShred and it will erase your existing cache. And unlike using your browser to clear your cache or history, you can use the internet right away, without having to wait for NetShred to finish.

NetShred X is more effective than simply clearing your cache because it will erase (not just delete) browser cache, history, download cache, QuickTime cache, favicons, email cache, email, junk and spam so the data can't be recovered.

NetShred X is available for immediate download, starting at \$24.95 or on CD-ROM, starting at \$34.95. Registered users can take advantage of this free update. Educational pricing and volume discounts are available. NetShred X runs on Mac OS X.
